

TOURNAMENT SPRAY

Most golf course superintendents face situations, at least once or twice a year, when greenspeeds are crucial for an event. Whether it's a member/guest event, club championship, or other important event, greens need to be quick, firm, and smooth.

The challenge with these events is timing. They often occur seasonally during the most challenging weather. Tournament preparation is key to producing great greens while giving the turf the best opportunity to thrive and survive. In addition to pre-event cultural practices, strategic fertility and plant health products help greens thrive and survive.

Foliar-Pak offers an effective program for applications leading up to these important events, helping support greener, firmer, smoother greens.

Foliar-Pak® CSi L | 1.5 - 2 oz per 1,000 sq ft

CSi L provides a highly concentrated form of foliarly absorbed silicic acid. Silicon helps strengthen cell walls, leading to improved leaf rigidity, more upright growth, a better cut, and smoother ball roll. Increased leaf rigidity also means better traffic tolerance, which is crucial when greens are rolled and double cut often. The specific amino acid paired with silicic acid in CSi L functions as an osmolyte within plant cells. It helps retain water in cells during drought stress, creating optimal cell turgor. This can help greens better withstand stressful event conditions and recover more quickly afterward.

Foliar-Pak® Foundation Forty | 1.5 - 2 oz per 1,000 sq ft

Foundation Forty is a concentrated amino acid supplement designed to increase plant energy production and improve stress tolerance. Foundation Forty and CSi L work together to strengthen the turf stand, improve texture, and increase density without pushing top growth. These two products are the backbone of a Foliar-Pak greens program, especially when greenspeed and playability are of utmost importance.

Foliar-Pak® Amperage | 3 oz per 1,000 sq ft

Amperage is a micronutrient package that provides great turf color and much more. Iron and manganese help optimize the photosynthetic process and improve color. Zinc plays an important role in enzyme development and the production of anti-stress compounds that help the plant protect itself from both biotic and abiotic stresses. Additionally, the specific amino acid in Amperage is a well-known antioxidant that protects the plant from cellular oxidative stress.

Foliar-Pak® Armament® K | 1.5 - 2 oz per 1,000 sq ft

The potassium in Armament K controls the translocation of carbohydrates, plant osmotic relations and is integral to protein synthesis. Turfgrass tends to use more potassium during periods of high respiration, so frequent foliar applications of potassium are very important.
